

I felt learning about “Graphical User Interface” (or GUI) was interesting enough. This week has taught me how it is an indirect language towards file folder coordinations. For instance, a repository is just a fancier word for folder. It helps one know where something is specifically at. As mentioned in the computer environment section, “we are mimicking the desktop”. Command Line Interface (or CLI) refers to receiving orders via line of text. It shows the ‘behind the scenes’ of the GUI. Instead of the presentable images of files/folders, this version allows someone to look at more detailed descriptions of how these files & folders operate. For example, if I were to see my documents I would then type CD for command directory and then input DOCUMENTS. In conclusion, this is all of what I learned about. Both GUI as well as CLI are not so different when you get to know each system more.
